

ABSTRACT

5 The closure device (121) includes a first fastening  
strip (130), a second fastening strip (131), a slider  
(132) adapted to be slidably disposed on the fastening  
strips. The slider (132) facilitates the occlusion of  
the fastening strips when moved towards a first end  
thereof. A first detent (137) is located at the first end  
10 of the fastening strips. The slider (132) includes a  
housing having a protrusion (5300) for engaging the first  
detent (137) of the fastening strips when the slider  
(132) is moved to the first end of the fastening strips.  
The protrusion (5300) and detent (137) prevent removal of  
15 the slider (132) from the first end of the fastening  
strips (130, 131) in the longitudinal X axis (102).
